- Sebastian Romo
- Lingzhe Wang
- Dr. Shengwei Zhu
The Importance

- Scientific studies on aerosol production in performing arts activities was lacking
- In order to get students back into the classroom, on stages, and performance venues at a lower risk, mitigations to aerosol are being tested
- Performing arts activities are essential for education and society
- Dr. Shelly Miller: “Aerosol generating activities have the potential to transmit COVID-19 as the research shows, but we have very little data on what kinds of generation happen when playing instruments. We will be studying this phenomenon in our aerosol laboratory at the University of Colorado Boulder and with this data, will be able to provide better evidence-based guidance.”
Preliminary Results Disclaimer

• These preliminary results are from our few weeks of exploratory testing. They will be further defined as the study continues. We are providing these preliminary results to assist in the safe return to classrooms. (Normally we do not release data until they have been quality assessed and peer reviewed).

• This study focuses strictly on the distribution of respiratory aerosols that are released while playing wind and brass instruments, singing, acting, speaking, dancing, and during a simulated aerobic activity.

• This study did not use a live virus or infected participants and therefore cannot be used to determine specific infection rates. This study was designed to (1) identify performing arts activities that generate respiratory aerosols including volume, direction, density, (2) estimate the emission rates of respiratory aerosol, (3) model the dispersion of these aerosols, and (4) investigate mitigation strategies.
Importance of Aerosol
Dr. Shelly Miller, TBA 2020

Quick Aerosol Primer
Definitions

- The Aerodynamic Particle Sizer spectrometer (APS) is based on the acceleration of *airborne* particles immersed in an air flow through a nozzle (measures 0.5-20 µm particles).
Oboe APS

Oboe APS: Total Concentration over Time

- scale, near bell
- play near bell
- scale, near keys
- play near bell with bell cover
- background

- Read

Concentration (A/cm²)

Time (minutes)
Trombone APS
Low Brass

![Graph showing Tuba and Euphonium APS: Total Concentration over Time.](image)
Theatre APS
Singing APS

![Graph showing concentration over time during soprano singing with various activities marked.]
Playing wind instruments, singing, and theatrical voice releases airborne particles (aerosol). These particles are of the size range that may transmit the COVID-19 virus. Performing with mask and bell cover reduces emissions.
Flow Visualization Explanation

RMFM 2020

Visualization of Flows from Musical Instruments

Abhishek Kumar, Tehya Stockman, Jean Hertzberg

Other project personnel:
Shelly Miller, Marina Vance, Sameer Patel and Darin Toohey

University of Colorado Boulder

This work is supported by the National Federation of State High School Associations, Performing Arts and Sports section and the College Band Directors National Association
Laser sheet visualization - Trumpet

Trumpet is behind laser sheet, pointing at camera. Bell is shown by white tabs. B flat produces the largest jets.

Flowvis.org
Laser sheet visualization - Oboe

Oboe aimed at camera. No bell cover.

Initial CFD Results for Well-Fitted Mask Impacts on Aerosol Spread

Shengwei Zhu and Jelena Srebric
Center for Sustainability in the Built Environment (City@UMD)
University of Maryland
July 31, 2020
Using computational fluid dynamics and the Wells-Riley equation, the City@UMD team has analyzed the concentration of airborne COVID-19 particles in outdoor and indoor case studies with a human body wearing a surgical mask with a 64% efficiency to capture aerosols of < 5 \( \mu \text{m} \).

The **outdoor study included a canopy tent of 3 m \( \times \) 3 m (10 ft \( \times \) 10 ft).** A person wearing the mask stands in a light wind field of 1 m/s (2.2 mph) at 10 m (33 ft) above ground, being roughly 0.2 m/s (0.5 mph) at a person’s height. The person is at the center of the open space covered by the tent.

The **indoor case study** represent a typical small rehearsal hall with a human body wearing the mask and standing at the center of the well-ventilated room.

The simulated results are compared to those of cases with person not wearing the mask, which were reported on 07/11/2020.

Animations of difference cases are being posted at: [https://city.umd.edu/covid-19](https://city.umd.edu/covid-19)
CFD Case Study Setups

**Outdoor Case** (20 m × 60 m × 20 m)

Inlet (green arrow):
Vel.: 2.2 mph at elevation of 10 m
Temp.: 22°C at elevation of 1.5 m

**Indoor Cases** (4.5 m × 4.0 m × 3.5 m)

Inlet (green arrow):
Size: 0.5 m × 0.5 m
Vel: 0.21 m/s (3 ACH)
Temp.: 22°C

Human Body: Area of 1.47 m² and Heat flux of 23 W/m²

Mask: Area of 107.7 cm², Velocity of 0.02 m/s (mass flow rate same as the exhaled air of the singer), and Temp. of 32°C

Covid-19 generation rate: 17.28 quant/hr with a 64% particle removal efficiency
**Outdoor Case:** Impact of Tent/Masks on Infection Risk

Infection risk $r$ by Wells-Riley equation at the height of mouth opening, with breathing rate of 8 L/min. Including 2.2 mph headwind at 10 meters, 0.5 mph at average head level.

- **t = 10 min**
  - Distance in meters
  - Without Mask
  - Perfect Fit Medical Grade Mask in a Canopy Tent

- **t = 30 min**
  - 0.5 mph Wind Direction

- **t = 60 min**
  - 0.5 mph Wind Direction

$r$ scale:
- 0.0
- 0.1
- 0.2
- 0.3
- 0.4
- 0.5
- 0.6
- 0.7
- 0.8
- 0.9
- 1.0
Tenting
**Indoor Case Study:** Mask Impact on Infection Risk

Infection risk $r$ by Wells-Riley equation at the height of mouth opening, with breathing rate of 8 L/min.

**Floor size:**
$4 \text{ m} \times 4.5 \text{ m}$

- Singing without mask
- Perfect Fit Medical Grade Mask

$t = 10 \text{ min}$
$t = 30 \text{ min}$
$t = 60 \text{ min}$
# Mask Fitting Importance

## Poor fitting mask
- Gaps on the sides
- Nose not covered
- Loose around the edges
- All of the above are poor fitting in their own right

## Better fitting mask
- No gaps on the sides
- Nose covered
- A fairly good fit around the edges

## Well fitting mask
- No gaps
- Nose covered
- Tight around the edges
- Should leave a mask outline once removed
In an outdoor space covered by the **canopy tent with fully open sides**, infection risk is significantly reduced by using a well fitted surgical mask. A tent with side panels would behave like any other indoor space and there would be no benefits in risk reduction by outdoor airflow in that enclosure.

In a well-ventilated indoor environment, the area (at the height level of mouth) with an infection risk of > 10% is limited around the person in a radius of roughly 1m/3ft after 60-minute exposure.

The CFD findings confirm that wearing a surgical mask with 64% particle removal efficiency can effectively reduce the spread of viral bioaerosols.

These numerical findings need to be compared to **actual experimental data** as numerical simulations cannot replace experiments when studying new transport phenomena, especially the ones that threaten human life.
Performing arts activities have been found to create aerosol that is less than coughing, but more than talking. The following considerations are effective for music, speech, theatre and debate activities.
The median particle size range for singing is 1.3 microns, and clarinet is 0.9 micron as general examples of particle sizing for this study. The Coronavirus has been measured at 0.1 micron.

More particle emissions near bell of wind instruments.

Bell covers should be used in multi-layer with filtering materials.

Particle emissions are comparable between all wind instruments, singing and acting except for oboe.

From the theater performance, projecting voice produces many more particles than regular talking. Looked like an instrument and singing.
### 5 Principal Takeaways

<table>
<thead>
<tr>
<th>Category</th>
<th>Details</th>
</tr>
</thead>
</table>
| **Masks**      | - Student  
                  - Instruments  
                  - Materials |
| **Distance**   | - 6-foot CDC guidance  
                  - Applies indoors and outdoors  
                  - 9x6 for trombone |
| **Time**       | - 30-minute rehearsal  
                  - Clear room for minimum 1 air change before next rehearsal period |
| **Air Flow**   | - Outdoors is best  
                  - HEPA Filtration  
                  - ACH Rates |
| **Hygiene**    | - Spit Valves  
                  - Handwashing  
                  - Storage Areas |
Masking – Fit Matters

• Wash your hands before putting on your mask
• Place it over your nose and mouth and secure it under your chin
• Try to fit it snugly against the sides of your face
• Make sure you can breathe easily
• Wear a mask correctly for maximum protection
• **Woodwinds and Brass** should use a mask while playing which includes a small straight slit in a surgical style mask
• Do not use the woodwind/brass mask outside of rehearsal
Masking for Wind Instruments
Mask the Person, Mask the Instrument

Person – Well Fitting

- Multi-layer
- Surgical Style Mask
- Washable or Disposable

Instrument – Multi-layers

- MERV 13 type material
- Surgical mask type material
- Something is better than nothing
- Non-stretchy material
Masks should be worn by all students and staff prior to entering the performing arts room. Masks should continue to be worn at all times.

Teachers should consider using a portable amplifier to keep their voices at a low conversational volume. Students should also ask questions in a low conversational volume with a mask.

Teachers are assumed to talk the most and as a result should wear the most efficient mask possible that is readily available, which are surgical masks. (N95s are not recommended at this time due to supply chain issues.)

No talking should occur in the room without a mask being properly worn.
Distance – It Matters

- CDC Guidance currently is 6-foot distancing
- Indoors
  - 6x6 area
  - 9x6 for trombone
- Outdoors
  - 6x6 area
  - Masks strongly recommended
  - Instrument bell covers should still be used
Time

• 30-minute rehearsal times
  • **Indoor**
    • Allow a *minimum* of 1 air change prior to next use of the room, 3 would be better.
  
  • **Outdoor**
    • Playing should cease for approximately five minutes to allow the aerosol to disperse.

• More study is needed prior to any recommendations of time changes
Air Flow

Outdoor is best

• Open air
• Tenting from elements

Indoor air filtration

• HEPA – Size of Room
• Filtration Certification
• CADR - Clean Air Delivery Rate
• AHAM Certification - Association of Home Appliance Manufacturers

Air Change Rate Per Hour (ACH)

• 3 ACH is the standard used for the modeling presented
• Increased ACH recommended if possible

ASHRAE Guidelines - American Society of Heating, Refrigerating and Air-Conditioning Engineers
Hygiene

Spit Valves

- Empty away from others
- Have an absorbent disposable material to catch the condensation (Puppy Pad)

Handwashing

- Hand sanitizer should be readily available
- Soap and Warm water should be available.
- Hands should be washed after contact with surfaces and others

Common Areas

- Should be managed to limit the number of students at a time in the room.
- Anyone who enters the room should bring a 70% alcohol wipe to wipe all surfaces before and after touching.
- The wipe should be discarded properly upon leaving the storage area.
